iDempiere E-Invoice Plugin for India GST (IRN)

iDempiere 13 | Java 17 | PostgreSQL | Whitebooks API

Sends completed sales invoices, credit memos and debit notes from iDempiere to the Indian e-invoice system (IRP), then stores the IRN, signed invoice and QR code on the document. Your team no longer keys invoices into a portal.

How it works

1. Complete the invoice and fill the few e-invoice fields that apply (supply type, reverse charge, export or e-way details).
2. Run "Generate E-Invoice (IRN)" for one invoice or for a date range.
3. The invoice is mapped to the IRP request and validated field by field, with readable errors that name the invoice line.
4. The plugin registers it through Whitebooks and handles token expiry.
5. IRN, acknowledgement, signed invoice, QR and e-way bill details are saved on the invoice.

What you get

Generate and cancel IRNs
B2B, SEZ, export and deemed export supply types, reverse charge, and cancellation within the 24-hour window.

Batch registration
Every completed sales invoice in a date range without an IRN. Each invoice succeeds or fails on its own, with a log line per invoice.

Duplicate recovery
If the IRP says the IRN exists, the plugin fetches it and matches document type, number, date, both GSTINs and total before attaching it.

Protection and audit trail
Blocks void or reverse of an invoice with an active IRN after 24 hours. Every attempt is stored with its raw response.

Per-organization setup
IRP credentials per client or organization, in encrypted columns, restricted to administrator roles.

What you need

- iDempiere 13 on Java 17 with PostgreSQL
- A GSTIN enabled for e-invoicing, an API user on the e-invoice portal and a Whitebooks account
- HTTPS access to the Whitebooks host (production IPs whitelisted with the provider)
- HSN/SAC codes on products and charges, GST state codes on regions

Developed and tested against the Whitebooks sandbox. B2C invoices are not supported by the IRP. Confirm production requirements with your provider.
