Razorpay Payment Link Plugin for iDempiere ERP

iDempiere 13 plugin | Spring Boot service | Razorpay

Email each customer a secure Razorpay payment link with the invoice PDF. When the customer pays, a Spring Boot service verifies the signed webhook and iDempiere posts the payment against the invoice, so nobody has to match and key it in.

How it works

1. Run the process in iDempiere with a filter. Ineligible invoices are skipped and reported.
2. The Spring Boot service creates a Razorpay link for the open amount, or reuses the active one.
3. The customer pays on the hosted payment link page.
4. The signed webhook is verified; the link is marked paid, or flagged if the amount differs.
5. A scheduled sync (every 5 minutes by default) pulls the paid link, completes the customer receipt and confirms back.

What you get

Bulk send with safety filters
At least one filter is required, so a send can never go to every open invoice by accident.

One live link per invoice
The same amount reuses the link; a changed amount cancels the old link at the gateway and issues a new one. Resend or Regenerate, with full history.

Safe with money
HMAC-SHA256 webhook verification, atomic event deduplication so retries never apply twice, and amount and currency checks before posting.

Mismatch and late payments
A different amount is flagged for review instead of posted. A payment on an expired or cancelled link is accepted and flagged.

No ERP credentials in the service
iDempiere pulls results and confirms each one, so the service never calls into your ERP.

What you need

- iDempiere 13 on Java 17 with PostgreSQL
- A Razorpay account (test mode works for evaluation)
- A place to run the Spring Boot service with its own PostgreSQL database
- A public HTTPS URL for webhooks, and a contact email on each business partner

Developed and tested in Razorpay test mode; not yet run with live payments. Only two-decimal currencies are supported. Confirm production requirements before going live.
